Introductory Workshop PRIMUS
30. 1. 2018

Point patterns – regularity and clustering

Cells

Poisson

Redwood

Point patterns – stationary and non-stationary

Stationary Poisson process

Non-stationary Poisson process

Point patterns – spatial and space-time

Monte Carlo testing: observed data

$$T(r) = K(r) - \pi r^2, \quad r \in [0; 0.25]$$

Monte Carlo testing: data curve

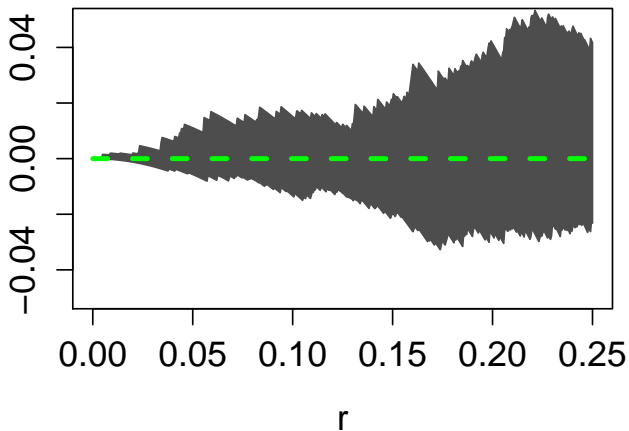

Monte Carlo testing: simulated curve

Monte Carlo testing: 39 simulated curves

Monte Carlo testing: envelope and T_{H_0}

Monte Carlo testing: envelope test

Exact envelope test, $n = 4999$, $\alpha=0.95$

Stochastic reconstruction – similarity of patterns

Stochastic reconstruction – similarity of patterns

Stochastic reconstruction – energy

Stochastic reconstruction – further examples

Stochastic reconstruction – further examples

Practical problem

Practical problem

Microscopic image of rabbit retina (neurons, amacrine cells).

red points – neurons in a deeper layer
blue points – neurons in a shallower layer
(they modulate the stream of information from the photoreceptors)

? How did this structure develop:

- 1 developed in the two layers independently?
- 2 developed in a single layer which later split into two parts?
